DataArt provides QA consulting to Credorax

27 Oct 15

UK, London, 26 October– Global technology consulting firm and end-to-end solution provider, DataArt, today announced a technical alliance with Credorax, a global digital merchant acquiring bank. DataArt's QA consultancy played a role in Credorax's recent go-live implementation of ePower 2.0, the company's **proprietary** single, unified and automated global-domestic payment platform.

The company specifically supported the integration of a 'fee prediction module' into the overall acquiring payment platform. DataArt was chosen because to their unique combination of complete (front-to-back) payment cycle domain knowledge, as well as proprietary development and testing methodologies of sophisticated financial services software. DataArt took part in both implementation and QA, establishing the right monitoring and assessment processes. Due to the challenging specifics of the fee prediction module, an advanced high performing system for automated user acceptance testing (UAT) was built and over 30,000 test cases were performed to ensure the solution was flawless and payments fully secure.

"This project has taken DataArt to a new level of expertise, and enabled us to showcase our abilities in the area of card payment acquisition technology," said Alexander Makeyenkov, senior vice president of Capital Markets, DataArt.

"DataArt's skills, creativity and fast turnaround time helped us to achieve spectacular results with our new platform," said Ilya Dubinsky, senior project manager, Credorax. "The company's payment cycle expertise and financial services software development experience made it a perfect fit for this project."
